

# Sink Stopper Knot

This is a useful knot to use to stop a thin rope from slipping out of a large hole.

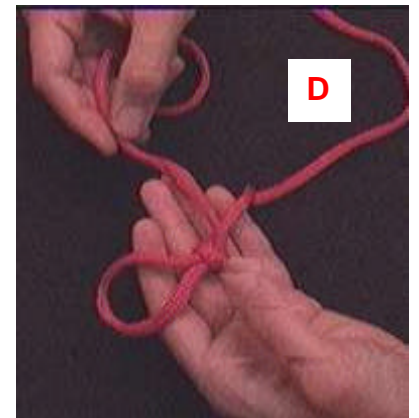

## How to tie a Sink Stopper Knot

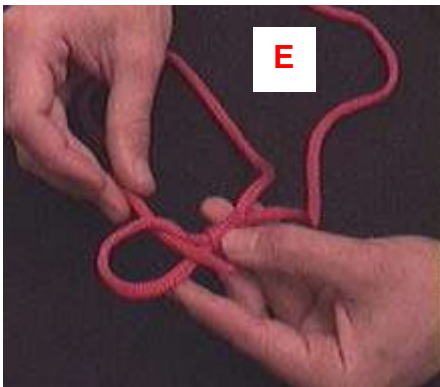

**(A)** Make a crossing turn. Now make a bight and pass it through the crossing turn (Just like for a Slipped Overhand Knot). **(B)**

**(C)** Tighten the crossing turn by pulling on the bight and the working end.

**(D)** Now bring the (short end) working end across the knot so it lies parallel with the previous turn.

**(E)** Then take the working end and pass it through the bight.

**(F)** Hold the knot with one hand and pull on the standing end with the other. You may have to work the knot into shape a little.
